Assignment 1

Philipp Epstein 10/14/2018

Introduction

This report is written for the 1st assignment of the Financial Trading Systems course 2018 at the Bond University. During the first weeks, we learned how to use the Blotter Framework in R to implement a trading strategy, backtest the approach on a set of instruments (stock, futures, etc.) and visualize meaningful results which give insights about the strategy. Moreover, we learned how to compare the strategy to another alternative investment (e.g., a buy and hold strategy). The results of the assignment, the chosen trading idea, implementation, analysis and results are summarized in the following report.

Trading Idea

Smash Day by Larry Williams

The trading idea which is used for this report is based on the Smash Day strategy introduced by Larry Williams in his book "Long-Term Secrets to short-term trading" 2012. The basic theoretical foundation is set by the concept of autocorrelation. There are two autocorrelation principles which can be empirically observed. The positive autocorrelation which describes the fact that if we see an upward movement, it is more likely to observe an upward movement in the future. The same is valid for a negative trend. However, the negative autocorrelation can be observed on short-term time periods. We can expect a price to bounce up again after a sharp down movement and vice versa. Larry William's Smash Day pattern is based on the observation of this autocorrelation behavior. A Smash Day pattern is initialized when we observe a closing price which is lower than the previous day's low price. This pattern looks like a breakout to the downside. If the very next day the price moves opposite the Smash Day and trades above the high of the Smash Day this is according to Williams a buy signal. Williams explains this buy signal with a feeling of hurt felt by the public as a result of an unfulfilled breakout. The public would want to get back on track, and the price responds with a reversal. The exact opposite is true for a Sell Setup. The Smash Day is set up when we observe a close above the previous day's high. The sell signal is initiated when the price reverses immediately the next day and falls below the smash day's low.

Own variation of the Smash Day trading strategy

In addition to the Smash Day pattern, I have incorporated another rule for the buy signal and two additional components for the sell signal. I want to make sure that I only enter long when we observe a longlasting upward trend. To do this, buy orders are only executed when the current price is above the exponential moving average of the last 400 days. After that, the Smash Day pattern is checked. For the sell, I incorporated two more conditions before checking whether we see a Smash Day (Sell) pattern. The first is that a maximum holding period can be set to make sure that a position is not open for too long. The second sell case is when the price falls below the 400-day exponential moving average. If both conditions are not the matched a check for the smash day pattern is performed. If we observe it, we sell the current position.

These variations are incorporated to reduce the risk of falling prices.

Implementation of the trading idea

Part A: Initialization

Step 1: General Setup

The environment has to be cleared to ensure a reproducable setup. Moreover, the blotter library and the INF361Course library are loaded.

```
# Clear Environment
rm(list=ls())

# Loading libraries
library(blotter)
library(INFT361Course)
```

Step 2: Setting the Variables

The variables set in the next section can be adjusted to test the strategy with different parameters. The critical variables which should be adjusted to test the strategy are: daterange, emaPeriod, maxHoldingPeriod, instrumentlist and BuyHoldInstrument.

```
# Set values:
startCapital <- 1e+6
transactionCost <- -20
daterange <- '2000::2018'
emaPeriod <- 400
maxHoldingPeriod <- 4
InstrumentDirectory <- "~/Desktop/R/DownloadedData/DAX/"</pre>
instrumentlist <- c("CON.csv", "DB1.csv", "IFX.csv", "MRK.csv", "WDI.csv")</pre>
BuyHoldDirectory <- "~/Desktop/R/DownloadedData/DAX/"</pre>
BuyHoldInstrument <- "DAXEX.csv"</pre>
currency("EUR")
Sys.setenv(TZ="UTC")
initdate <- '1999-12-31'
startdate <- '2000-01-01'
enddate <- '2018-12-31'
portfolioname <- "Smash Day"
accountname <- portfolioname
```

Step 3: Presetup for plotting graphs

Theme setup for plotting the graphs in the visualization is performed here to ensure that the theme is available later, when it is needed and used.

```
# Settings for graph
myTheme <- chart_theme()
myTheme$col$up.col <- 'lightblue'
myTheme$col$dn.col <- 'brown'
myTheme$col$dn.border <- 'lightgray'
myTheme$col$up.border <- 'lightgray'

# Concatenate string for EMA with input parameter
addEMAString <- paste("add_EMA(n=",emaPeriod,")",sep = "")</pre>
```

Step 4: Initializing the portfolio

The portfolio and account are initialized.

Part B: Bar by bar processing

Step 1: Go through the data bar by bar

In this step the bar by bar processing is implemented. Therefore, a for loop is used to go through the instrumentlist. For each instrument in the list the data is loaded and the exponential moving average is added to the data. Furthermore, another for loop is used to go through the dates bar by bar. In this step the chosen strategy is applied.

```
for (instrument in instrumentlist) {
    LoadCourseFile(InstrumentDirectory, instrument, debugme = TRUE, dates = daterange)
    # Initialize the instrument
    stock(instrument, currency = "EUR")
    # Load the XTS file
    symbol <- get(instrument)</pre>
    # Calculate the Exponential Moving Average
    ema <- EMA(symbol$Close, n=emaPeriod)</pre>
    # Merge the xts file with the Exponential Moving Average
    symbol <- merge(symbol,ema)</pre>
    assign(instrument,symbol)
  # Starting to go bar by bar through using a "for loop"
  for (i in (emaPeriod + 1):(nrow(symbol) - 1)) {
    # Dates
    CurrentDate <- time(symbol[i])</pre>
    TomorrowDate <- time(symbol[i + 1])</pre>
    # Today's variables

    EMA_today <- as.numeric(symbol[i, "EMA"])</pre>
    LowToday <- as.numeric(symbol[i, "Low"])</pre>
    HighToday <- as.numeric(symbol[i, "High"])</pre>
```

                TxnPrice = as.numeric(symbol[i, "Close"]),
                TxnQty = -Position,
                TxnFees = transactionCost
            }
          }
       }
      }
   }
   updatePortf(portfolioname, Symbols = instrument, Dates = CurrentDate)
   updateAcct(accountname, Dates = CurrentDate)
   updateEndEq(accountname, CurrentDate)
  } # End Bar-by-bar processing
} # End for loop for multiple instruments
```

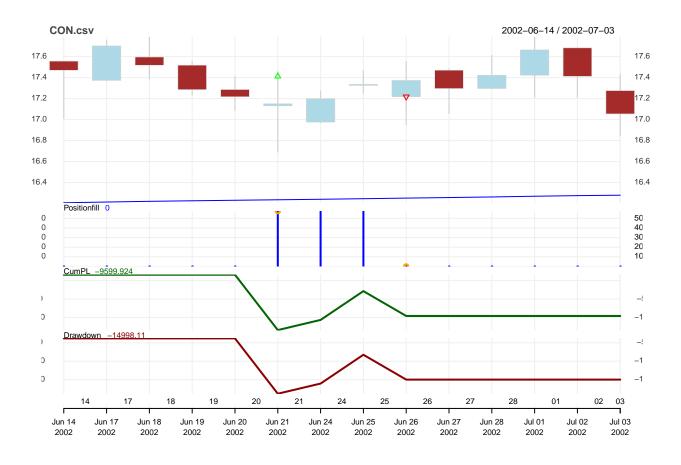

Step 2: System Check

In order to make sure that the system works as designed, the plots of some choosen transactions are printed in the following section. The plots for the first, third and the 5th last transaction are plotted for every instrument in the instrumentlist. The plots can be checked manually and by this it can be ensured that the transactions were performed as expected.

```
# Loop through all instruments in the instrumentlist
for (instrument in instrumentlist){
    rm(daterange_check)
    daterange_check <- c()
    transactionsInstrument <- getTxns(Portfolio=portfolioname,Symbol=instrument)

# Create a list of transactions to check
for (i in</pre>
```

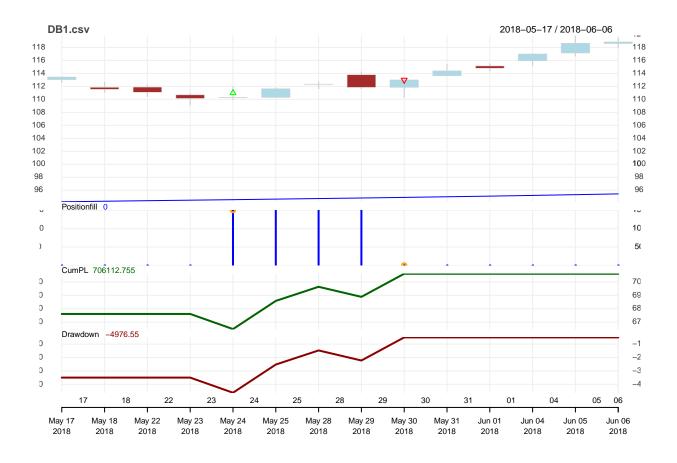

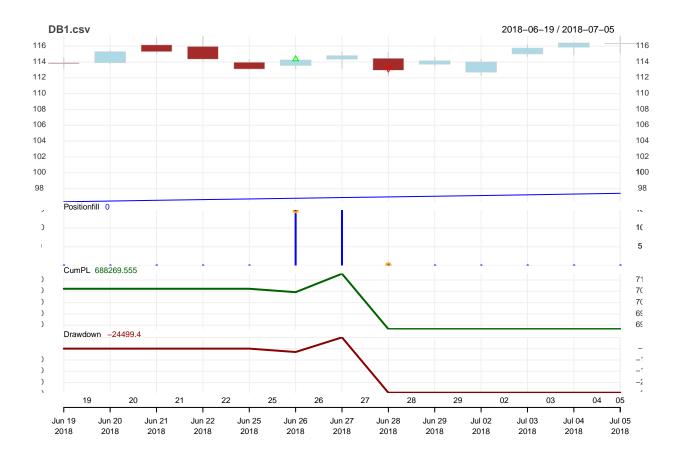

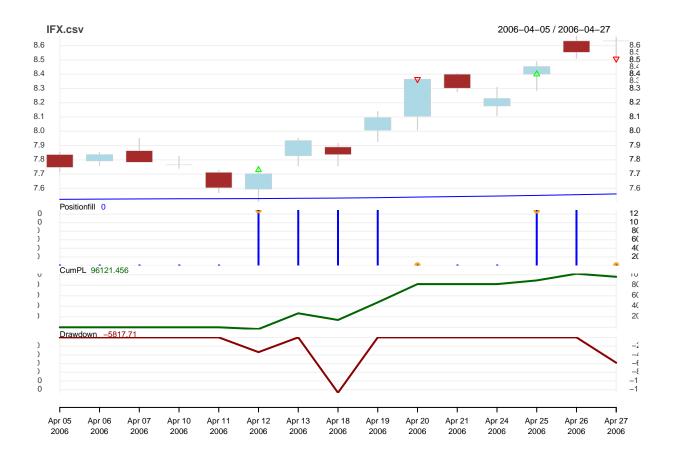

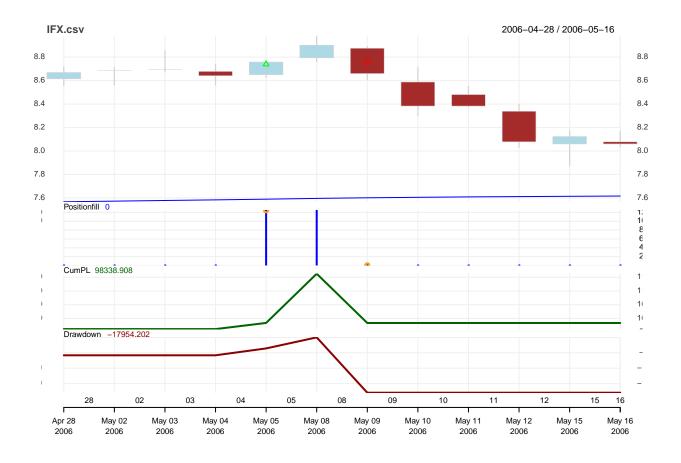

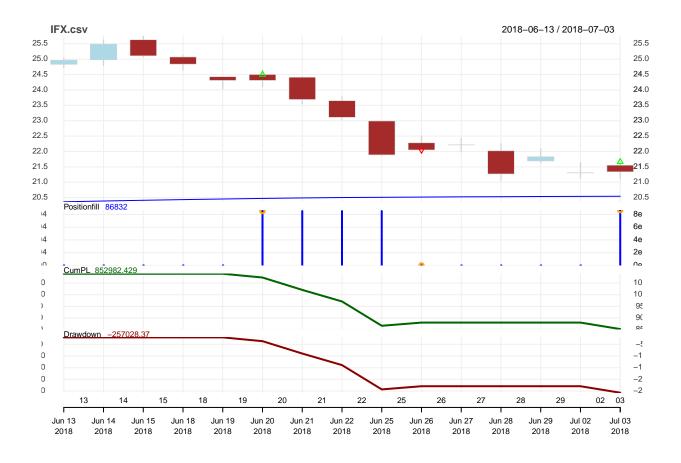

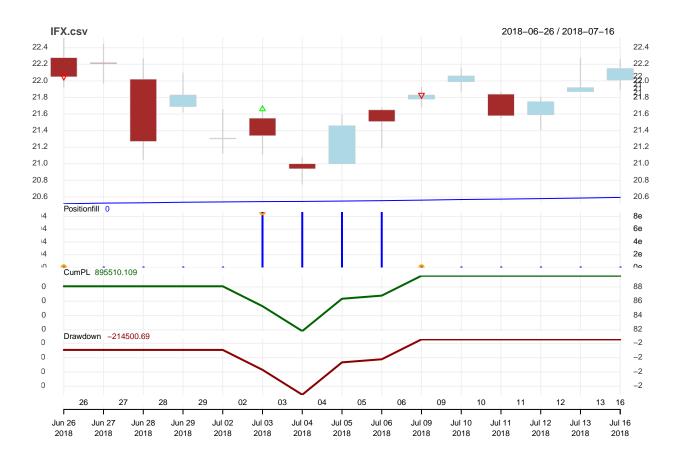

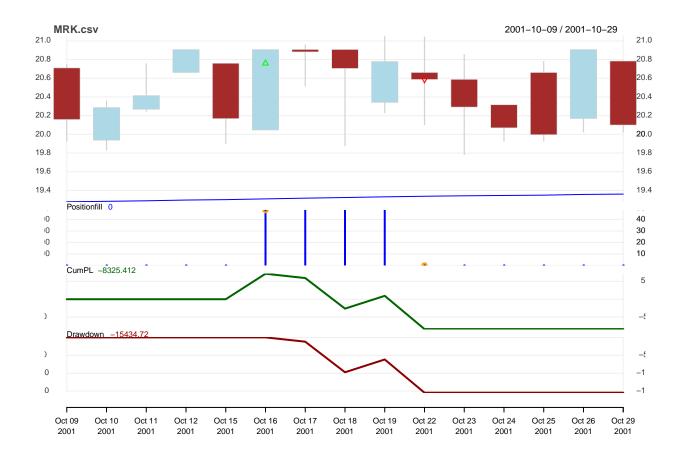

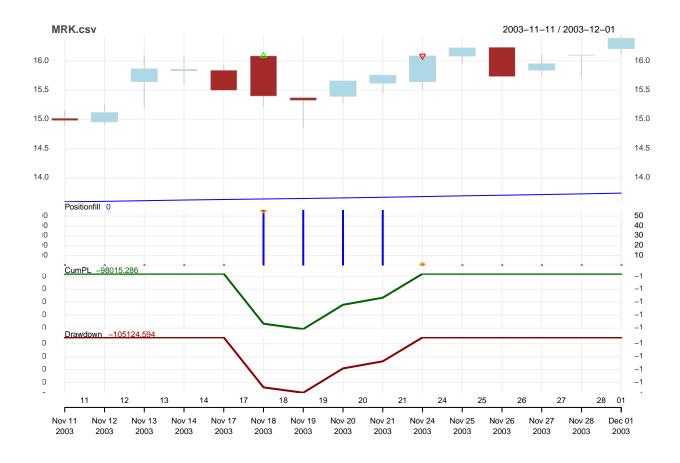

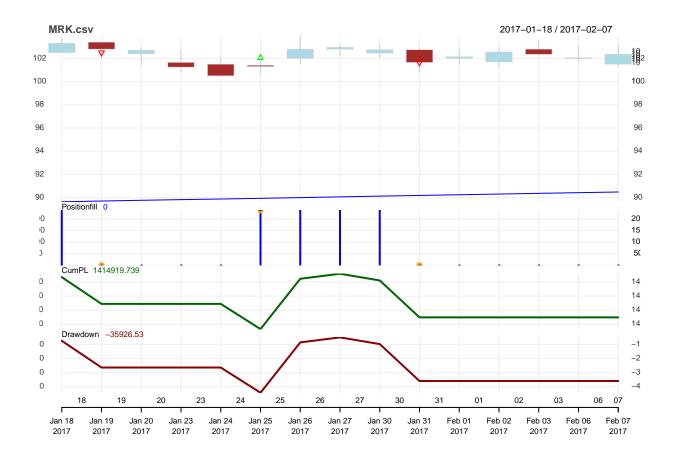

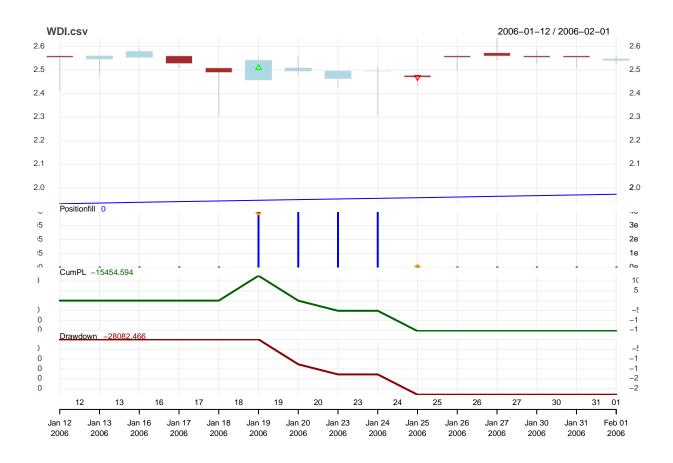

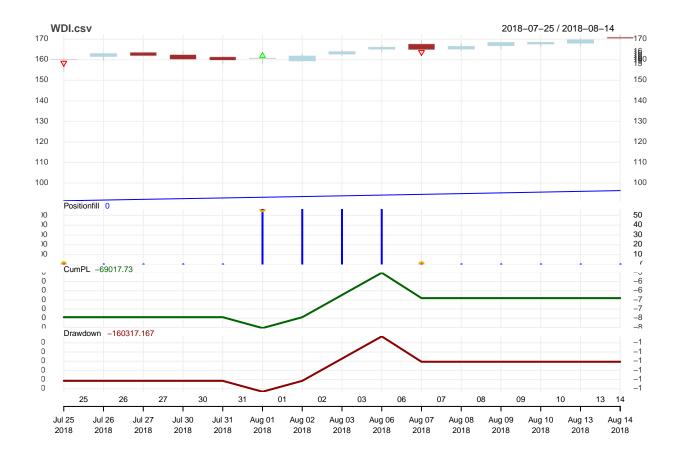

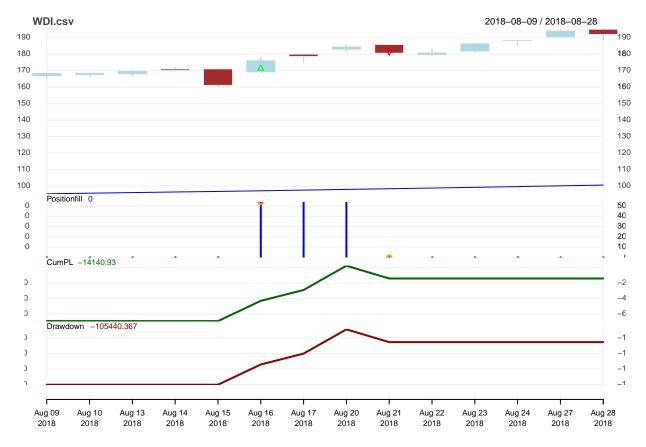

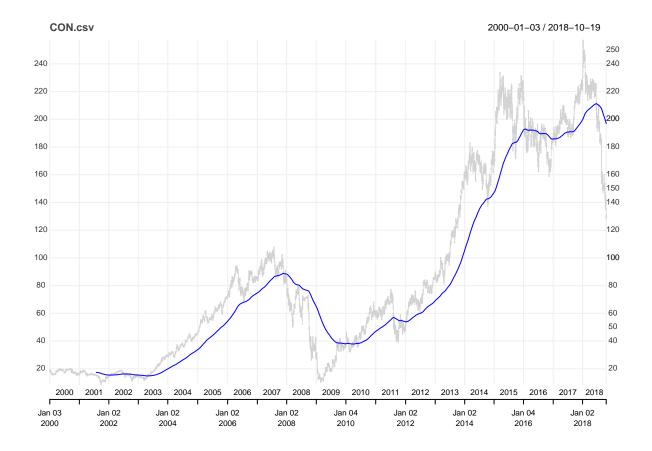

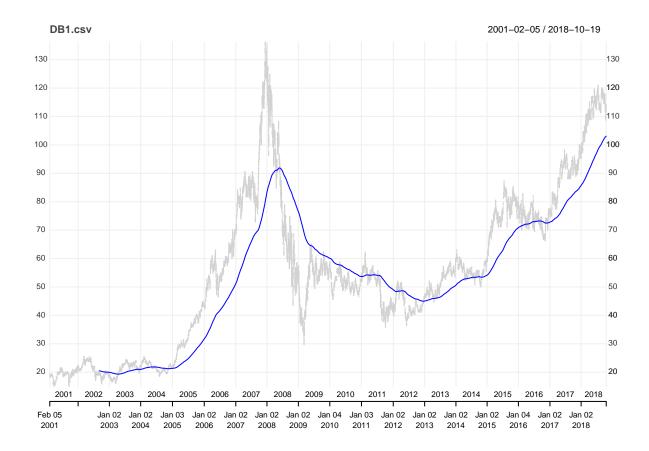

The plots of the chosen transactions show that the system works as designed. As a variety of transactions is plotted across many different instruments, we observe all possible patterns. The buy orders are all performed correctly after observing a Smash Day pattern. The sell orders do work as expected. The maximum holding period is applied and sell orders are placed after a maximum holding period of 4 days. Price drops below the EMA line lead to a sell transaction and also the smash day pattern can be observed which leads to a sell transaction.

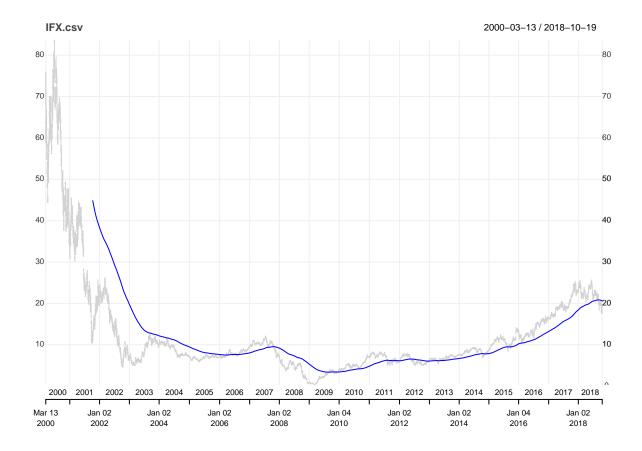

Part C: Analysis and Reporting

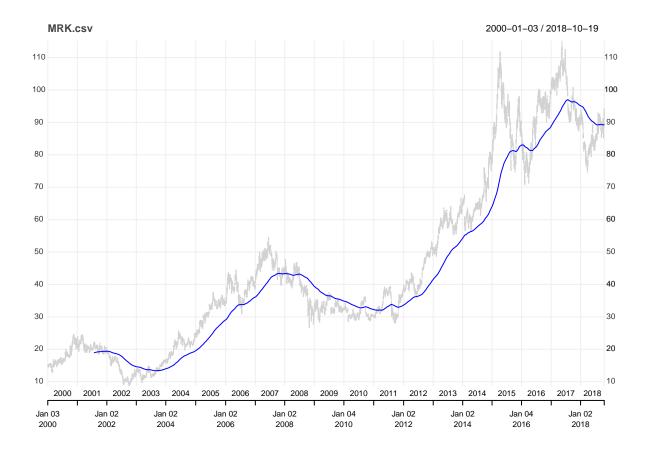

Step 1: Visualize original data

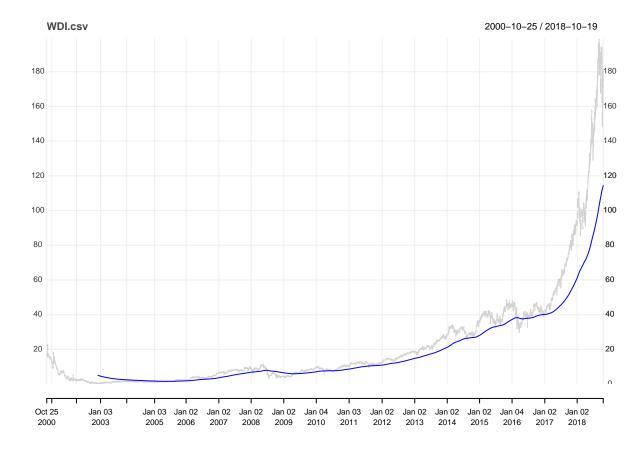

The following section shows plots of the instruments with the EMA line which indicates the general trend of the stock exponentially smoothed for the last 400 days. This plots can be used to get a first impression of the long term trend of the instrument and to see which general behaviour of the price movement can be observed.

Step 2: All transactions performed by the trading system

The following table can be used to get a better overview of the transactions performed and the exact details like the quantity, price and value per transaction. The table can be used to compare certain trades, make sure that the trades were executed as expected and use it as a reference, when looking for trades of a specific instrument at a specific time.

```
for (instrument in instrumentlist){
  print(sprintf("Transactions for the instrument: %s", instrument))
  txns <- getTxns(Portfolio = portfolioname, Symbol = instrument)
  txns.pr <- txns[,c(1,2,4,6)]
  colnames(txns.pr) <- c("Quantity", "Price", "Value", "Net realized Profit")
  print(txns.pr)
  writeLines("")
}</pre>
```

```

Step 3: Visualize all transactions, profit and drawdown

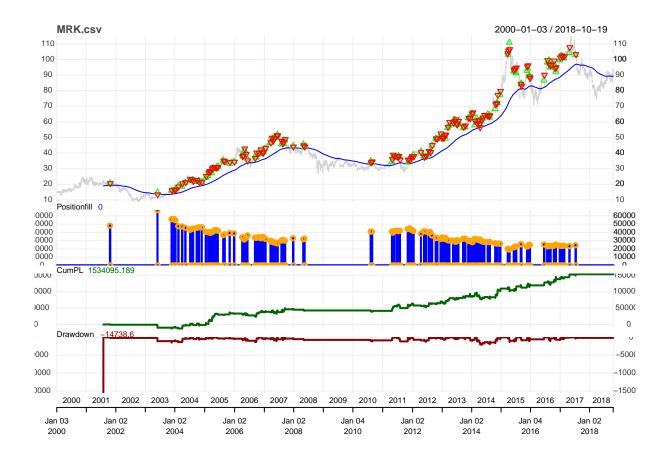

The following graphs show the combined view of the performance of the Smash Day trading system. It visualizes the trades (buy-transactions are visualized in green and sell-transactions are visualized in red). Moreover, the size of the blue squares indicates the size of the position (height) and the holding duration of the position (width). The green line shows the cumulative net profit curve, while the red line indicates the drawdown on each day compared to the last reached high. The first look on the graph shows us, that trades are only performed above the EMA line. Moreover, we see the cumulative profit / loss and drawdowns. The time series can be used for further investigation of the strategy.

Step 4: Performance Statistics

To analyze the results of our strategy appropriately we need to create some statistical measures which indicates how well the strategy performes. The following table summarizes some important trading statistics for all instruments. This statistic is just an excerpt of the available statistics which can be calculated and displayed. It is printed here as it can be assumed that they are interesting for investors to rate the trading strategy.

```

Step 6: Visualize returns of the trading strategy for every instrument

After performing the strategy, we have full access to the returns for each and every instrument which was tested. The following plots vivualize the cumulative return, the daily return and the drawdone for each insturment. This allows a good first overview of the performance of the strategy for the instruments used.

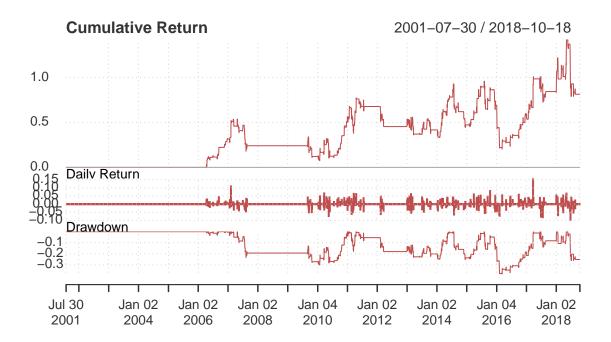

CON

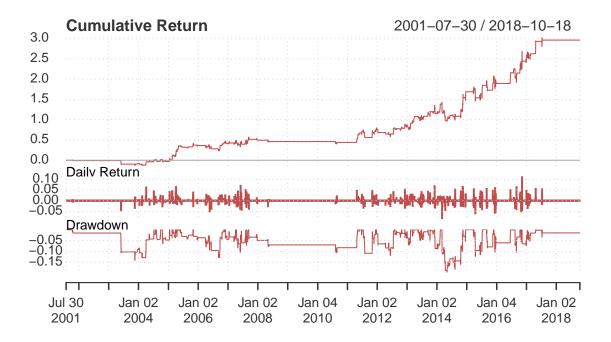

DB1

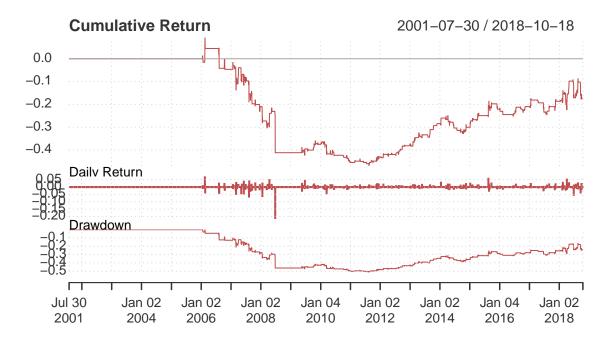

IFX

MRK

WDI

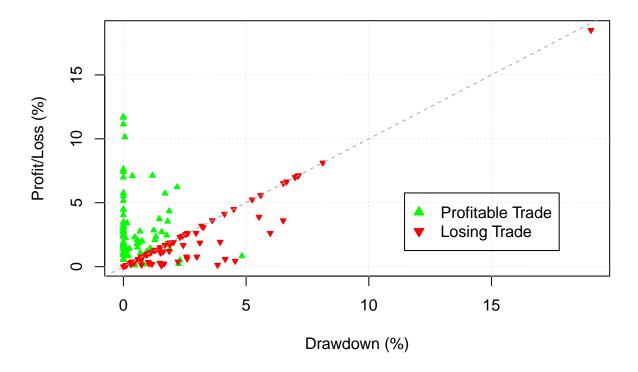

Step 7: Could we have performed better or even worse? MAE / MFE

The efficiency of a strategy is also dependent on the question whether we could have performed better or worse. This can be shown with the maximum adverse excursion and the maximum favorable excursion. The Maximum Adverse excursion shows how much we could have lost at most during the trade, while the maximum favorable excursion shows how much we could have earned more than we did. In the MFE case we want all trades to be as close to the diagonal line as possible. Every movement to the bottom right sight can be interpreted as a not realized opportunity to earn higher returns.

Compare with Buy and Hold Strategy

After having analyzed the strategy extensively, a comparison to another strategy should be made to evaluate the performance based on a benchmark which could have been an alternative investment. In this case a simple buy and hold strategy is used. At the first date of the trading period we place a buy order and sell our position at the last day of the selected period. In order to do this, we create a new Portfolio and a new Account. As stocks from the DAX (German Stocks Market Index) are used in the strategy, the buy and hold strategy is performed on an DAX ETF.

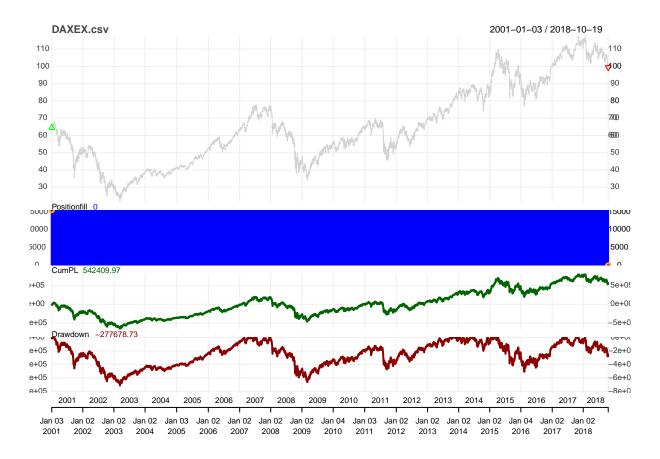

Step 1: Perform the Buy and Hold Strategy

```
BuyHoldInstrument,
          initDate=initdate,
          currency="EUR")
initAcct("buyhold",
         portfolios="buyhold",
         initDate=initdate,
         initEq=startCapital,
         currency="EUR")
# The first date of the defined daterange is selected
currentdate <- first(time(BuyHoldSymbol))</pre>
# The close price at this date is selected
closeprice <- as.numeric(Cl(BuyHoldSymbol[currentdate,]))</pre>
# Calculate the unitsize we can buy with our startingcapital
unitsize <- as.numeric(trunc(startCapital/closeprice))</pre>
# Place the transaction for the instrument at the first date
addTxn("buyhold",
       Symbol=BuyHoldInstrument,
       TxnDate=currentdate,
       TxnPrice=closeprice,
       TxnQty=unitsize,
       TxnFees=transactionCost)
# Select the last date of the daterange period
lastdate <-last(time(BuyHoldSymbol))</pre>
# Select the price at the last date
lastprice <- as.numeric(Cl(BuyHoldSymbol[lastdate,]))</pre>
# Sell the position at the last date of the daterange
addTxn("buyhold",
       Symbol=BuyHoldInstrument,
       TxnDate=lastdate,
       TxnPrice=lastprice,
       TxnQty=-unitsize,
       TxnFees=transactionCost)
# update portfolio and account
updatePortf(Portfolio="buyhold")
updateAcct(name="buyhold")
updateEndEq(Account="buyhold")
```

Step 2: Visualize the Buy and Hold strategy

When visualizing the strategy in the same way we visualized the Smash Day strategy, we can see that we hold the position from the first until the last date. The cumulative profits are visualized by the green line.

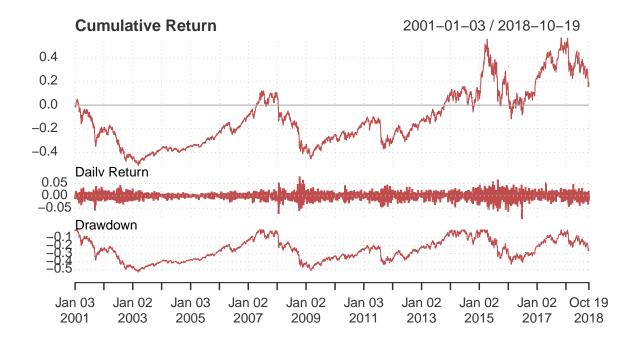

```
chart.Posn("buyhold",Symbol=BuyHoldInstrument, theme=myTheme)
```

Step 3: Compare the returns of the trading strategy with the buy and hold strategy

In order to compare the results of both strategies, we calculate the returns for the buy and hold strategy and combine them with the returns of the trading strategy which were calculated before. Then the cummulative return, the daily return and the drawdown is plotted to visualize the performance of the buy and hold strategy.

DAX

In order to compare the performance between the strategy investment in one of the stocks and the alternative buy and hold strategy of the DAX ETF, the following graphs visualize the relative performance between each of the stocks used and the DAX ETF. Before that, more statistics are printed. These statistics compare information about the returns of the five instruments and the buy and hold strategy. Furthermore, annualized statistics are provided for the returns, standard deviation and the sharpe ration. These information can be used in order to form first assumptions when comparing the strategies.

The Return versus Risk Graph plots the five instruments and the DAX buy and hold instrument and visualizes the performance of the strategies versus the risk which was taken. This is the first visualization of a direct comparison of the strategies.

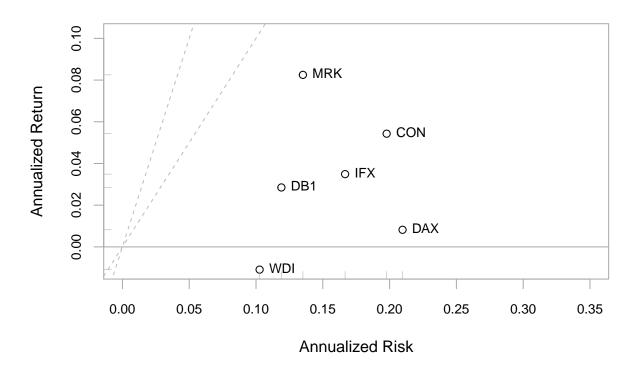

In order to better see the direct comparison of the instruments used and the alternative investment in the DAX ETF with a buy and hold strategy, relative performance plots are printed for each instrument and its relative performance compared to the DAX ETF.

Calculations and visualizations based on returns

As we have the returns of the instruments available, we can perform calculations and visualizations based on the returns of the strategies. The following section contains graphs of the returns, the equity curve and a histrogram of the simple returns. Moreover, the histogram graph has an overlay with a randomly created normal distribution in order to compare the distribution of the returns with a normal distribution. As expected the returns are not normally distributed. We can observe fat tails, which means that large negative and large positive returns can be observe more often than expected and the excess kurtosis is visible.

Value at Risk

The historical "Value at Risk" measures the risk of loss for investments. More specifically, it describes the maximum amount we would expect to lose per day with a confidencelevel of 99%, given an investment of 10000. This metric could be used to show potential investors the risk which is associated with their investment. Based on the following results, an investor could decide whether the risk is appropriate compared to the expected returns which were shown in the previous sections.

```
round(loss,2)*-1))

## [1] "Given a 10000 investment in CON we would expect a maximum loss of 399.32 per day."

## [1] "Given a 10000 investment in DB1 we would expect a maximum loss of 237.56 per day."

## [1] "Given a 10000 investment in IFX we would expect a maximum loss of 394.24 per day."

## [1] "Given a 10000 investment in MRK we would expect a maximum loss of 291.27 per day."

## [1] "Given a 10000 investment in WDI we would expect a maximum loss of 183.06 per day."
```
